

Evacuslider

Rescue-Sheets

Evacusliders are a modern version of the Rescue-sheets, used in hospitals and care homes, to slide patients to safety during an evacuation. Unlike the older type of rescue-sheet, which is typically fixed to the underside of a hospital mattress, all Evacusliders are quick to deploy and very easy to use.

Evacusliders provide a cost-effective solution where a mobility impaired person requires evacuation from a multi-level building as they overcome difficulties often found during evacuations, such as the restricted width of narrow corridors, staircases and fire escapes. Patient comfort comes in the form of a thick foam mattress with a super smooth underside, making it suitable for moving persons who need to be transported horizontally.

We currently offer 2 models of Evacuslider rescue-sheet, each offering a different level of comfort and flexibility; the **Standard Evacuslider** is our basic feature, entry-level model, while at the top-end the **Premium Adjustable Evacuslider** provides additional comfort and is fully adjustable and flexible, making it ideal for securing people of differing sizes from small children up to large adults.

◀ A simple and cost-effective evacuation solution; **The Standard Evacuslider** is a thick foam mattress with a super smooth underside

◀ **The Premium Adjustable Evacuslider** takes rescue-sheets to the next level. It is fully adjustable and flexible enough to fit people of varying heights and sizes
